

# Knife-edged Ruler, surface level test

**J9122004**

The straightedge is a measuring tool used for checking that a surface is level using the light gap method. The straightedge is used specifically to check cylinder heads when changing the cylinder head gasket. If the engine is overheated, the cylinder head may

move. To exaggerate the issue slightly, the cylinder head is bent. The straightedge can be used to measure whether this bend is still within the permitted tolerance.

**Thickness:** 16 mm      **Width:** 36 mm  
**Lenght:** 600 mm
